Carbon Nanotubes: Advanced Topics In The Synthesis, Structure, Properties And Applications (Topics In Applied Physics)

Synopsis

Building on the success of its predecessor, *Carbon Nanotubes: Synthesis, Structure, Properties and Applications*, this second volume focuses on those areas that have grown rapidly in the past few years. Contributing authors reflect the multidisciplinary nature of the book and are all leaders in their particular areas of research. Among the many topics they cover are graphene and other carbon-like and tube-like materials, which are likely to affect and influence developments in nanotubes within the next five years. Extensive use of illustrations enables you to better understand and visualize key concepts and processes.

Book Information

Series: Topics in Applied Physics (Book 111)

Hardcover: 720 pages

Publisher: Springer; 2008 edition (March 11, 2008)

Language: English

ISBN-10: 3540728643

ISBN-13: 978-3540728641

Product Dimensions: 6.3 x 1.3 x 9.4 inches

Shipping Weight: 3 pounds (View shipping rates and policies)

Customer Reviews

The carbon nanotubes field has evolved substantially since the publication of the bestseller "*Carbon Nanotubes: Synthesis, Structure, Properties and Applications*". The present volume builds on the generic aspects of the aforementioned book, which emphasizes the fundamentals, with the new volume emphasizing areas that have grown rapidly since the first volume, guiding future directions where research is needed and highlighting applications. The volume also includes an emphasis on areas like graphene, other carbon-like and other tube-like materials because these fields are likely to affect and influence developments in nanotubes in the next 5 years.

A. Jorio received his Ph.D in Physics from the Universidade Federal de Minas Gerais (UFMG), Belo Horizonte, Brazil, in 1999. He is a Professor of Physics at UFMG since 2002, and is a conseiller of

the Brazilian National Institute of Metrology (INMETRO) since 2006. He worked previously in various research institutes like the Institute Laue-Langevin (ILL), Grenoble, France and the Massachusetts Institute of Technology (MIT), Cambridge, USA, and has been awarded with the PROFIX and Productivity grants from Brazil. He co-authored with Profs. Dresselhaus a book of the applications of group theory to condensed matter physics. His research activities cover the optical properties of nanomaterials and the fundamental aspects of nanometrology. M. S. Dresselhaus received her Ph.D. in Physics from the University of Chicago, in 1958. She is an Institute Professor at the Massachusetts Institute of Technology and has been active in many aspects of condensed matter and materials research with particular emphasis on carbon science including nanostructures such as carbon nanotubes and fullerenes, but also including nanowires and other nanomaterials systems relevant to low dimensional thermoelectricity. She is the recipient of the National Medal of Science in the US and 24 honorary degrees worldwide. She served as the Director of the Office of Science at the DOE in 2000--2001 and co-chaired a DOE report "Basic Research Needs for the Hydrogen Economy (2003). G. Dresselhaus received his Ph.D. in physics from the University of California in 1955. He was a faculty member at the University of Chicago, and on the physics faculty at Cornell University before joining the MIT Lincoln Laboratory in 1960 as a staff member. In 1976 he assumed his current senior staff position at the MIT Francis Bitter Magnet Laboratory. His area of interest is the electronic structure of nanomaterials and he has co-authored with M.S. Dresselhaus several books on fullerenes, nanowires, and nanotubes.
